

Innovating
our sustainable
tomorrow

Decarbonization Plan 2026–2030

Reducing our footprint to
drive a circular economy
with lower climate impact.

Where are we today?

Our evolution

2022

Carbon footprint calculation since 2022

Systematic emissions measurement since the start of the program.

2023

Verification and international audits

Processes validated under globally recognized standards.

2024

Scopes 1 and 2 consolidated

Inventory of direct emissions and indirect energy emissions already established.

2025

Scope 3 in development

Advancing toward complete measurement of the value chain.

Our objective

Grow while reducing emissions per tonne produced

The increase in recycled plastic production must be accompanied by technological improvements that make it possible to minimize greenhouse gas emissions.

Our four pillars

Electrification

Renewable energy

Energy efficiency

Measurement and continuous improvement

Roadmap 2026–2030

2026

Measure to act

- First Scope 3 calculation
- Energy monitoring of Castellet
- Consolidation of the emissions inventory
- Continue electrifying internal logistics

2027

Invest in clean energy

Location: Castellet Recycling Plant

- Commissioning of the Castellet photovoltaic plant
- Expected generation: 2 GWh/year
- Estimated reduction: 516 tCO₂e/year

2028

Optimize processes

Location: Castellet Recycling Plant

- Waste heat recovery from the compressors is recovered and used to preheat the feed material entering the deodorizer
- Savings of 1.030 MWh/year
- Approximate reduction of 266 tCO₂e/year
- First Scope 3 reduction analysis

2029

Transform mobility

- Greater electrification of internal logistics
- Progressive renewal of the corporate fleet
- Assessment of replacing fossil fuels in thermal installations

Analysis

- First Scope 3 reduction analysis

2030

Consolidate decarbonization

- Maintain a Scope 2 (market-based) close to zero
- Incorporate specific objectives for Scope 3
- Update the plan with new technologies and improvement opportunities

Our commitment

Decarbonization is a continuous process based on measurement, innovation, and ongoing improvement.

Each action brings us closer to a more efficient, resilient industrial model aligned with global emissions reduction goals.

**We measure to
improve. We innovate
to reduce. We grow
more sustainably.**
